

# The MCP Gateway for Graph8 Work Intelligence

An AI operations layer for software teams: Graph8 agents + MCP tools + evidence-backed summaries from GitHub and Linear.

Graph8 Hackathon

OudenX

MCP-first

# The problem

Software teams work in fragments. Managers see the fragments late.

## Work happens everywhere. Context lives nowhere.

A developer opens Linear, GitHub, chat, and spreadsheets before writing code. Status reports become manual, stale, or exaggerated. Important decisions disappear into scroll.

4+

apps before code

20m

daily context loss

0

trusted audit trail

GitHub: PRs, commits, reviews

Linear: issues, priorities, deadlines

Chat: decisions, blockers, action items

# The hackathon thesis

Graph8 should not just call tools. It should understand work.

## MCP connects apps. Réseau makes the connection useful.

Raw MCP tools expose application actions. Software teams need higher-level work context: who did what, what is blocked, what changed, and which source proves it.

# What we are building

A product demo plus a reusable Graph8 MCP improvement layer.

## PRODUCT

### Réseau Dashboard

A clean team operations surface: Start My Day, Ask Réseau, and evidence-backed daily reports.

**Demo**

visible

## INFRASTRUCTURE

### Réseau MCP Gateway

A bridge that turns multiple MCP sources into coherent, reliable, provenance-aware work tools for Graph8.

**Gateway**

reusable

# Architecture

Graph8 is the agent layer. Réseau MCP Gateway is the work context layer.

# First milestone: connection testing

Before building features, prove the Graph8 + MCP path.

## Test the integration before the product.

The first hour is not UI. It is validation: connect GitHub MCP, connect Linear MCP, discover tools, invoke read-only actions, then combine both in one Graph8 agent request.

- 01 Connect each MCP server
- 02 Discover tools inside Graph8
- 03 Invoke read-only actions
- 04 Use both MCPs in one request
- 05 Record auth, timeout, and transport issues

# The better MCP

Not a dumb adapter. A semantic work gateway.

## Expose fewer tools. Make them smarter.

Instead of forcing Graph8 agents to stitch together dozens of low-level app calls, Réseau exposes a small set of work-native tools.

```
get_my_day_context()
```

```
get_person_activity(person, date)
```

```
get_project_context(project)
```

```
get_team_summary(date)
```

```
get_evidence(activity_id)
```

# Demo 1

Start My Day: one click, one grounded briefing.

## Good morning, Malik.

### Focus today

UI Critic Phase 3 is the highest priority.  
It is waiting on PR #9 to merge.

### Needs attention

2 unresolved review comments on your active PR.

### Yesterday

6 commits across 2 repositories.

Output: a concise, grounded morning brief with exact evidence available on demand.

# Demo 2

Daily reports that can be verified, not just generated.

## Every sentence links back to source data.

Réseau does not ask the model to invent a report.  
The gateway returns counts, records, and evidence.  
Graph8 turns verified facts into readable status.

### Daily Report - Sep 26

Completed: 1 Linear issue

Merged: 1 GitHub PR

Blocked: Phase 3 until PR #9 lands

[View evidence: ENG-142 / PR #9 / SHA abc123](#)

# Why Graph8 should care

Réseau is a product demo and a platform improvement story.

01

## Interoperability

Bridge transport and MCP compatibility gaps so more tools can connect to Graph8.

02

## Agent-friendly tools

Compress raw APIs into semantic operations that agents can use reliably.

03

## Trust layer

Add evidence, source IDs, freshness, and permissions around every generated claim.

**The pitch is not "we found a weakness." It is: "we found an opportunity to make Graph8 MCP stronger."**

# Hackathon build plan

A practical path from connection tests to a compelling demo.

**Decision rule: if direct MCP works, focus on semantic quality. If it breaks, ship the bridge.**

# Build with Graph8. Strengthen Graph8.

Réseau starts as a Graph8 hackathon dashboard for software teams. The deeper value is the MCP Gateway: a reusable layer for interoperability, semantic tools, and evidence-backed agent outputs.
